

Persistent layer in Texas Meadows

Date

Sat, 04/02/2022 - 18:00

Activity

Skiing

With the MSU Avy 2 class today. We dug 3 separate pits on the NE aspect off the top of Texas Meadows. Two pits had ECTX and one inbetween had an ECTP23 @ 55cm down failing on a persistent facet layer. Bottom half of the entire snowpack was still facets to the ground. Boot sunk to the ground once we reached that layer in the pit.

Region

Bridger Range

Location (from list)

Texas Meadow
