

Unreactive tests in the Gallatin

Date

Sat, 01/07/2023 - 13:00

Activity

Skiing

Dug a hasty pit on E facing 23 degree slope at 8100 ft above Sportsman Lake. Overall snow depth 165 cm. Found all the familiar suspects including depth hoar, the Thanksgiving weak layer and two 1F layers between 4F layers in the top 60 cm of the snowpack. CT and ECT both produced no results. Temps were warmer in the valley, but didn't show signs of being above freezing above 7500ft.

We skied mellow terrain anyway and made very sporty turns on our nordic skis.

Region

Southern Gallatin

Location (from list)

SOUTHERN GALLATIN RANGE
