

New Snow Lick Creek

Date

Mon, 01/16/2023 - 12:00

Activity

Skiing

Variable skiing at Lick Creek today. 2-3 inches of low density snow on the ground. Ski cutting on the north side wind roller produced very soft-soft slab results with little to no propagation directly under cornice. 4 inch soft slab on the interface. Ran about 20 feet with little entrainment.

It squalled out there around 12pm snowing S2 with little to no wind. That seemed to precede the squall in town by about 2 hours.

Region

Northern Gallatin

Location (from list)

Lick Creek
