

Variable in Hyalite

Date

Sat, 02/24/2024 - 09:00

Activity

Skiing

We noticed that a widespread crust had formed at lower elevations from the recent warm spell, especially in areas without consistent shade. The snow that remained available for transport was easily being picked up by moderate to strong SW winds at treeline. Many tracks had been filled in by the wind transported snow, and a dense, hollow windslab was found in isolated spots.

Region

Northern Gallatin

Location (from list)

Lick Creek

Observer Name

Wyatt Hubbard
