Activity

Snowboarding

Toured up lick creek on Thursday morning. Mostly Cloudy, pretty warm around 37 degrees. Wind was gusting fairly hard at the ridge from the SW and had deposited and compacted lot of snow on the top of the NE Bowl. Dug a quick pit around around 8000' on the NE side of the ridge. Snowpack was about 60 cm deep and a quick compression test failed around CT 24 on near surface facets about 4 cm from the ground. The block that failed was a cohesive slab about 50 cm thick.

Region

Northern Gallatin

Location (from list)

Lick Creek

Observer Name

Alex A
