Activity

Skiing

Toured up into the basin below Emigrant to take a look around. HS varied from about 30 cm in wind stripped areas to 100cm around 8000 feet. On a NE aspect at the same elevation we found about 4in of new snow over a slab sitting on a faceted layer, which did not move easily in a hand shear. Heard from another party that they had no results in a pit in a similar location. Large cornice formation on E facing ridge lines. We stayed down low and had great supportable skiing.

Region

Out of Advisory Area

Location (from list)

Emigrant Peak
